

Get online and produce The Grain Chain website!

ICT

Now you have explored the grain chain and discovered how ICT supports every stage, either for data storage and manipulation or the

control of key processes, it's your chance to tell the world how ICT will improve the future of bread and flour production - and create even more nutritious fun food products!

Work with your group to design and develop an interactive website which allows anyone to take past data (say on wheat production or grain storage sites) and extrapolate into the future. You'll need to think about spreadsheets and the web, data capture and ways of testing your predictions. You may want to build several different models to test your ideas and improve design.

Once you have built web-friendly spreadsheet tables, think about the graphic design of your website and make sure its easy, clear and fun to use!
